Project: FRUIT SHOP MANAGEMENT

Create a project with the following 4 tables:

- Account(id, username, password, role)
- Fruit(id, name, category, price, quantity, expiryDate, description)
- Customer(id, fullname, phone, email, accountId)
- Order(id, customerId, orderDate, totalAmount, status)

And required functionalities:

- Login: Implement a login function with two roles: Admin and Customer, and provide the corresponding functions for each role.
- Login Account Storage: Store login account information using SharedPreferences.
- Data Storage: Store the tables using SQLite or Room Database.
- Admin Functions: Allow administrators to add, update, delete, search, and view fruit information, including name, category, price, quantity, expiry date, and description.
- Expiry Date Management: Display fruit expiry dates and identify expired fruits. Prevent customers from ordering expired fruits.
- Customer Functions: Allow customers to view available fruits, search for fruits, check expiry dates, place orders, and view their order history.
- Order Management: Allow customers to place orders and allow administrators to update order statuses, such as Pending, Confirmed, and Completed.
- Version Control and Collaboration: Work together and manage the project code using GitHub or GitLab.
- Scoring: The score is based on the time taken to complete the project. The less time a student takes, the higher the score.
